**ABSTRACT**

Dam Reservoir Sieniawa (130 ha) located on the Wisłok River above Besko, has been stocked with whitefish since 1992. In 1995-1997 sexually mature fish were caught in autumn. The paper presents the results of the first studies on length and weight of whitefish caught in Sieniawa Dam Reservoir. The results are compared with whitefish growth in Lake Gołdopiwo from which the stocking material had been obtained.
